Museum of Science & Industry, Chicago IL

**T**his exciting new exhibit experience explores the inner-workings of the information super-highway. Innovative sensing hardware and software technology raises the bar on interactive museum exhibits.

Our goal was to create an immersive lighting environment that was exciting and dynamic while also working to direct visitor focus to important graphic information. Deep color washes striking reflective metallic surfaces work to give the exhibit an electric feel. Great care was taken to assure that exhibit lighting elements did not conflict or otherwise compromise both front and rear projected media.
